

I claim:

1. In combination, safety glasses and attached reading glasses, said safety glasses comprising eye shields having side portions and temples connected to said side portions, for engaging a wearer's ears, a support member having opposite end positions, means for pivoting each end portion of said support member to respective side portions of said eye shields, said support member being spaced outwardly from the front of said eye shields, and reading glasses pivotally connected to the medial portion of said support member, whereby the support member and reading glasses can be either pivoted to an out-of-the way position from the front of the safety glasses or the reading glasses can be pivoted about the support member in front of the safety glasses to provide enhanced focus for the wearer.

2. The combination of claim 1, wherein the support member comprises a bowed wire.

3. The combination of claim 2, wherein the means for pivoting each end of the support member to the side portions of the eye shields, and each end of said bowed wire extending transversely through the side of a respective stub shaft.

4. The combination of claim 3, wherein a bead is mounted on each end portion of the bowed wire, the portion of the bowed wire extending through a side of the stub shaft being bent, to thereby cause the bead to abut the opposite side of the respective stub shaft, whereby the bowed wire is maintained at a predetermined distance spaced outwardly in front of the safety glasses
